

Cohort-signature probe -- a LIMITATION QUANTIFIER, not a positive result
High separability was expected given already-quantified age/platform confounding;
it bounds interpretability of the sealed SLE-vs-healthy AUROCs, it does not validate them.

Source: results/l2_cohort_signature_probe.json. PREREG.md Section 5.1, not Holm-corrected, not part of the co-primary family. Trained fresh on cohort-membership labels; touches no frozen model, no sealed disease score, no raw sealed-cohort data.
